qscreen-filing-tool — lossless filing JSON, math-identity gates, attestable provenance.

A jurisdiction-agnostic Python engine that turns any exchange's annual or interim report into a schema-stable, audit-traceable JSON object.

Six months in production. 499 tests. 124-check regression bench at 80.6 %. Hardened supply chain (SBOM + Sigstore + SLSA L3).

Multi-arch container on ghcr.io. Public 6,000-word whitepaper.

THE PROBLEM

Financial-document extraction is broken at the final mile. Existing tools fall into three categories:

1. **LLM-only extractors** — hallucinate numbers at 5–10 % rate; can't fingerprint output across engine upgrades; expensive at scale (\$0.04–0.12/filing).
2. **Layout-only tools** (`pdfplumber` , `camelot` , `marker`) — give you text or Markdown, but not a structured, schema-stable JSON contract.
3. **Vendor APIs** — opaque, expensive, vendor-locked, no cryptographic provenance.

Downstream pipelines re-ingest every quarter because they can't trust hash stability. Compliance teams can't answer “*which engine version produced this row?*” without a database comment. Quant desks re-do reconciliation by hand because the JSON can't be trusted to be internally consistent.

THE SOLUTION — THREE BETS

1. **Deterministic-first extraction.** PDF tables are parsed in code (`pdfplumber`). The model only fills gaps (audit opinion, notes, segments). Numbers never pass through the model — so a 270M local model produces the same numerical contract as a frontier cloud model.
2. **Math-identity gate at the write path.** The JSON cannot ship if it contradicts itself (`Assets ≠ L + Equity` $\pm 2\%$, with eleven cross-cutting + twenty-five issuer-specific pre-flag rules). Blocked records stay on disk with evidence pointing at the offending line item; they never propagate.
3. **SHA-256 cross-filing fingerprints + Sigstore keyless signing + SLSA Build L3 attestation.** Every release produces a wheel, an SBOM, a Sigstore bundle, a SLSA v1 receipt, and a multi-arch container. The chain is verifiable by a third party without cooperating with the operator.

TRACTION

	v1.0 (Mar 2026)	v1.6.0 (Sep 2026)
Lines of engine code	~6,000	~10,500
Unit tests	499	
Bench checks	30	124
Bench pass rate	60 %	80.6 %
Pre-flag rule coverage	9 / 25	25 / 25
Cross-platform CI	Ubuntu only	Ubuntu + macOS + Windows
Supply chain hardening	none	SBOM + Sigstore + SLSA L3 + CodeQL
Public install paths	1 (PyPI)	3 (Releases CDN + PEP 503 simple index + container)
Documentation	README	README + 9-section whitepaper + hosted docs site
Cross-post drafts	none	HN + Lobsters + Reddit + Product Hunt + LinkedIn + Medium + Hacker Noon + X threads

MARKET

Financial-document data infrastructure is a \$XB annual market served by Bloomberg, Refinitiv (LSEG), S&P Capital IQ, CalcBench, Sentio, AlphaSense, and a long tail of regional vendors. Each has the same problem: the ingestion path is brittle, the fingerprint stability is fake, and the provenance is opaque.

The open-source moat: - **Jurisdiction-pluggable**. The Qatar profile ships with 55 tickers; AE / SA / KW are one-directory-drop extensions. New markets can be added without re-engineering the gate or the fingerprint. - **Supply-chain trust**. Compliance teams cite our SBOM + Sigstore + SLSA receipts in their internal documentation — and we don't pay for that PR. - **Profile as content**. Each jurisdiction profile is a deep artefact (Qatar = ~6,000 lines of seed + 25 pre-flag rules). The cost of building a UAE/Saudi/Kuwait profile is the asset; the engine is the commodity.

ASK

Tier	\$/yr	What you get
Bronze — \$5k	Logo on the README + GH Sponsors page.	
Silver — \$15k	Above + 1 day/month of priority feature work.	
Gold — \$50k	Above + private Slack channel + 6-month exclusive first-look at new releases + co-marketing on Show HN / conference abstracts.	

Equivalent grant funding via NLnet, Sovereign Tech Fund, MOSS, or GitHub Sponsors accepted at any tier.

WHAT THE MONEY BUYS

UAE jurisdiction profile (Q4 2026) · audit-opinion classification model trained on gate-flagged disagreements · multi-PDF batch orchestrator with SQLite-backed resume · OpenSSF Scorecard “gold” tier hardening (currently ~7.5/10) · conference presence (PyCon US 2027 + PyData Berlin 2027 + SIGMOD Demo Track 2027; CFP abstracts in [campaign/conference/](#)).

TEAM

qscreen-filing-tool maintainers — the same small team that built the engine, the bench, the supply chain, and the launch kit. Six months of full-time focus; v1.0 through v1.6.0 shipped with zero failed release gates. Maintainer: OxBingBong69 (GitHub); background in quant data infrastructure and MENA financial markets.
